

## Data management plan

All products and deliverables created during the course of the project will be made freely and publicly available. Stanford University Libraries has also agreed to put all the products (source code, documentation, images, etc.) time-stamped at the end of the grant period, in a dark archive for long-term storage.

1. The white paper, as well as any reports, articles, and research notes, will be hosted on a Stanford University web site dedicated to this project and stored in the Stanford Digital Repository.

2. The source code for the components will be documented and made freely available for download, reuse, and modification in a public repository at GitHub, a cloud repository service widely used in software development. A snapshot of the source code and documentation at the close of the grant period will be stored in the Stanford Digital Repository.

3. Though the web-application development is not part of this grant proposal (see section 5 above), it is the platform upon which we will integrate the visual components, so we will make the source code for the web-application, including documentation, available for download, reuse, and modification in a public repository at GitHub. A snapshot of the source code and documentation at the close of the grant period will be stored in the Stanford Digital Repository.
